

ERP transformation with reliable data at its core

Use Collibra to organize and speed up your SAP ERP modernization — and with data governed and ready to use on day one.

Embracing change is how you win the innovation game. Upgrading to the latest SAP ERP will give you access to faster, better analytics — and there are ways to reduce the complexity.

Collibra helps you organize your data for a faster, more efficient implementation. Automations make asset tagging and classification easier, and workflows and intuitive UX let you bring non-technical stakeholders in to collaborate on stewarding and governing data.

You don't want to migrate unreliable, duplicate or incomplete data into a new ERP. Collibra's automations help you confirm accuracy, consistency and completeness before implementation, for a data house that's in tiptop shape. It means cost savings and better results.

Plus, Collibra lets you govern all your data, in and out of SAP. You can apply data policies as you organize your implementation so you're ready to go on day 1 — and with a platform that lets every user across your organization find and access SAP and non-SAP data.

Innovate faster and better with Collibra + SAP.

Check and improve data reliability as you go

You can use Collibra to organize and structure your data for your ERP modernization.

Collibra uses AI to confirm data reliability and minimize post-implementation cleanup. It automates detection of missing values and records, schema changes, null values, duplicates and other quality issues so you don't replicate them in your new system.

Data reliability activities shouldn't end after launch. Collibra alerts you to data anomalies and provides data about their lineage. This gives your technical and non-technical stakeholders the information they need to define key quality checks and provide specific remediation tasks to address issues.

Help your data find its use cases

Your data can do a lot more for you if everyone who needs it can find it. Collibra enhances discoverability with context and associations that improve the search experience and promote serendipitous discovery.

You can use features that automate data classification and data categorization suggestions to describe assets, and it's easy to bring your non-technical stakeholders in to add context to describe the data.

It's a key step to data empowerment that sets you up for long-term advantage.

Be ready to go on day 1

Your SAP ERP modernization will be measured on adoption and effectiveness of what people do with the new tools. Collibra makes it easier to apply governance as you organize your transition so your people can use it as soon as it's implemented.

Effective governance means making your data ready for use — while keeping your organization safe. Risk comes in a lot of forms: data breaches, regulatory penalties and drawing the wrong conclusions because people didn't understand data context or quality.

On the flip side, there's risk in moving too slowly to use data. Organizations that don't empower people to use data — the right way, and at scale — will squander this advantage.

Collibra unifies governance to enable your people to trust, comply and consume data within parameters that keep them safe. It's not just SAP data; it's every data source across your organization.

And you don't have to add governance after the fact: you can build a structure for scalable, consistent governance as you organize your transformation. Collibra makes it easy to bring in non-technical stakeholders across lines of business, risk and compliance, legal and other teams to collaborate in designing and applying policies.

The platform applies data policies consistently, with customization that addresses line-of-business nuances.

Collibra also retains data lineage and other rich context about every asset from source to target, preserving critical context.

It expedites appropriate access once data is migrated, and gives everyone in your organization the means to find, understand and request access.

The result? Your data is governed and ready to go on day 1.

Data Confidence is key

When you have the right infrastructure in place, you can deliver data into more hands, faster, and with a higher degree of trust and compliance.

- Expedite time to data value
- De-risk data projects
- Use trusted data with AI

- Extend and unify data governance across all data stores
- Streamline data initiatives
- Accelerate competitive advantage

Instill more confidence in data outputs when everyone understands the inputs.

Collibra + SAP: Better together

Collibra helps SAP customers empower users to innovate with data for exploration, analytics and AI — while keeping your organization safe. It means you can accelerate every use case..

Enhance data discovery and collaboration.

The partnership lets people find and access data across your whole organization. Give your people access, context and guardrails to empower safe innovation.

Build trust in data.

Scale data reliability and build trust in data-driven initiatives. The partnership gives you access to automations that ensure data quality across all sources and at every stage of the data pipeline.

Deliver trusted AI.

Enhanced data governance for every source fuels better AI outcomes. Automate visibility, control and tracing with Collibra's AI Governance module, the first to create active links between data and AI use cases, from input through output.
